RE: EnergyMaster Make-up Air Equipment with the Patented Floor-Operated Air Direction Controller and SeasonMaster Tuff Duct.

Dear Mr. Hall:

The EnergyMaster make-up air equipment we installed over 15 years ago has helped with our long running negative air pressure problems.

The system has accomplished our goal of introducing make-up air year round. With your guidance, the system was designed and it was simple to install in a very short time without any problems.

We recently decided to add the Floor-Operated Air Direction Controller and SeasonMaster Tuff Duct to our system. Now, we simply rotate a mechanical control on the unit to change the air direction back and forth from cold weather to hot weather. This is done easily from the floor in seconds.

After installing the patented SeasonMaster System it became evident the EnergyMaster System, with the SeasonMaster Air Direction Controller, is the best way to introduce make-up air as well as providing summer ventilation. We now easily change air direction, from the floor several times daily if needed, to either blow upward during the cold weather or downward during hot weather. Happily, the versatility of the SeasonMaster has eliminated the employee complaints of being "too hot" or "too cold", especially in between seasons.

Thank you for your prompt response to our needs.

Sincerely,

Glenn W Watkins
